

# 2-bit dual supply level translator without direction control pin

#### **Features**

- 42 MHz: 84 Mbps (max) data rate at
   V<sub>L</sub> = 1.8 V, V<sub>CC</sub> = 3.3 V
- Bidirectional level translation without direction control pin
- Wide voltage range  $(V_{CC} \ge V_I)$ :
  - V<sub>L</sub> ranges from 1.65 to 3.6 V
  - V<sub>CC</sub> ranges from 1.65 to 5.5 V
- Power down mode feature when V<sub>CC</sub> supply is off, all I/Os are in high impedance
- Totem-pole driving
- 5.5 V tolerant enable pin
- ESD performance on all pins: ±2 kv HBM
- Small package and footprint: QFN10 (1.8 x 1.4 mm)

### **Applications**

- Low voltage system level translation
- Mobile phones and other mobile devices

### **Description**

The ST2129 is a 2-bit dual supply level translator which provides the level shifting capability to allow data transfer in a multi-voltage system. Externally applied voltages,  $V_{CC}$  and  $V_{L}$ , set the logic levels on either side of the device. Its architecture allows bidirectional level translation without a control pin.

The ST2129 accepts  $V_L$  from 1.65 to 3.6 V and  $V_{CC}$  from 1.65 to 5.5 V, making it ideal for data transfer between low-voltage ASICs/PLD and higher voltage systems. This device has a tri-state output mode which can be used to disable all I/Os.

The ST2129 supports power-down mode when  $V_{CC}$  is grounded/floating or when the device is disabled via the OE pin.

### 3 Supplementary notes

#### 3.1 Driver requirement

For proper operation, the driver from each side of the device must have the capability to source and sink a minimum of 1mA current. The device architecture requires the driver to source/sink a maximum current of  $(V_{CC}/4)$  mA to/from the weak 4 k $\Omega$  output buffer.

### 3.2 Load driving capability

To support the architecture that allows level translation without direction pin, the one-shot transistor is turned on only during state transition at the output side. After the one-shot transistor is turned off, only the 4 k $\Omega$  resistor maintains the state. So, resistive load or pull-up resistor less than 50 k $\Omega$  is not recommended for a proper operation.

#### 3.3 Power off feature

In some applications, where it might be required to turn off one of the power supplies powering up the level translator, the device is automatically disabled when  $V_{CC}$  supply is turned off, even if the OE pin is set to HIGH (enabled). In this mode, all I/Os are in high impedance state.

#### 3.4 Truth table

Table 3. Truth table

Enable	Bidirectional Input/Output					
OE	I/O <sub>VCC</sub>	I/O <sub>VL</sub>				
H <sup>(1)</sup>	H <sup>(2)</sup>	H <sup>(1)</sup>				
H <sup>(1)</sup>	L	L				
L	Z <sup>(3)</sup>	Z <sup>(3)</sup>				

- (1) High level  $V_L$  power supply referred.
- (2) High level  $V_{CC}$  power supply referred.
- (3) Z = High impedance.

Maximum ratings ST2129

### 4 Maximum ratings

Stressing the device above the rating listed in *Table 4* may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
$V_{L}$	Supply voltage	-0.3 to 4.6	V
V <sub>CC</sub>	Supply voltage	-0.3 to 6.5	V
V <sub>OE</sub>	DC control input voltage	-0.3 to 6.5	V
