### DESCRIPTION

The /SS/ IS66WV1M16EALL and IS66/67WV1M16EBLL are high-speed, 16M bit static RAMs organized as 1M words by 16 bits. It is fabricated using /SS's high performance CMOS technology.

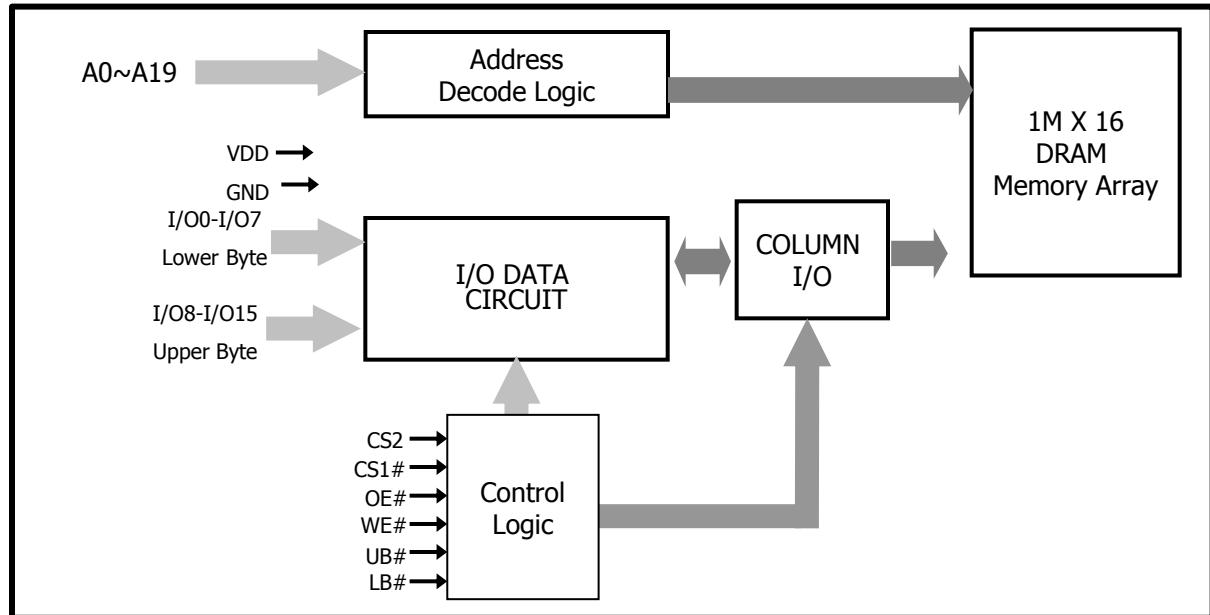

This highly reliable process coupled with innovative circuit design techniques, yields high-performance and low power consumption devices.

When CS1# is HIGH (deselected) or when CS2 is LOW (deselected), the device assumes a standby mode at which the power dissipation can be reduced down with CMOS input levels.

Easy memory expansion is provided by using Chip Enable and Output Enable inputs. The active LOW Write Enable (WE#) controls both writing and reading of the memory. A data byte allows Upper Byte (UB#) and Lower Byte (LB#) access.

The IS66WV1M16 EALL and IS66/67WV1M16EBLL are packaged in the JEDEC standard 48-ball mini BGA (6mm x 8mm). The device is also available for die sales.

## POWER UP INITIALIZATION

IS66WV1M16EALL and IS66/67WV1M16EBLL include an on-chip voltage sensor used to launch the power-up initialization process. When VDD reaches a stable level at or above the VDD (min) the device will require 50 $\mu$ s to complete its self-initialization process. During the initialization period, CS1# should remain HIGH. When initialization is complete, the device is ready for normal operation.

The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signals that terminates the Write.

## AVOIDABLE TIMING and RECOMMENDATIONS

Figure 4a : tCSM Violation

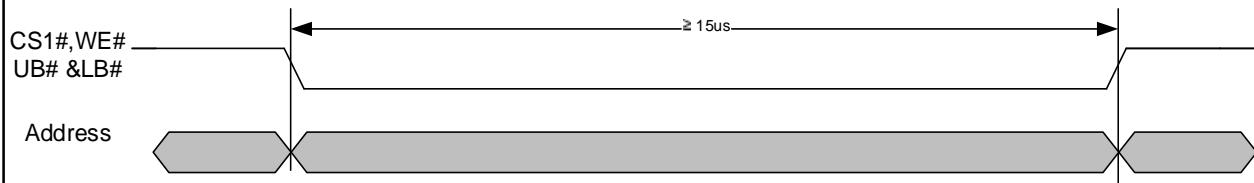

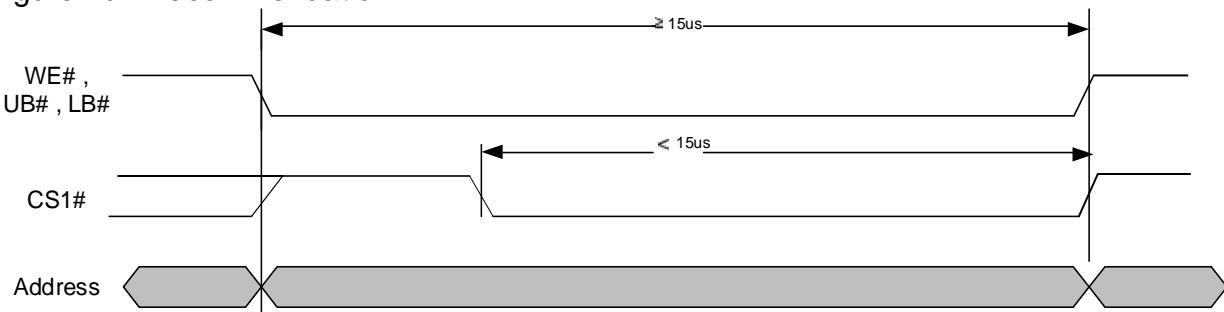

Figure 4b : Recommendation

### Notes:

1. PSRAM uses DRAM cell which needs a REFRESH action periodically to retain the information. This REFRESH action is performed only when the device is not selected (Chip Select Pins are Disabled). A hidden REFRESH action has to be executed by the device at least once every 15  $\mu$ s of tCSM.
  2. Figure 3a shows a timing example in which consecutive READ cycles for more than 15 us . This timing should be avoided for proper REFRESH operation.  
REFRESH operation can begin only during Chip Select pins are Disabled (CS1# is High and CS2 is Low ) for more than 5ns. Example on how to avoid tCSM violation in Figure 3a is shown in Figure 3b.
  3. Figure 4a shows a timing example in which a single WRITE operation is maintained for a period greater than 15  $\mu$ s. Since a proper REFRESH action cannot be performed during device is selected by Chip Select pins, information stored in the device will not be retained if this timing occurs.
- Figure 4b is a timing example of using CS1# signal toggling for proper the WRITE operation
