

Dual Precision, Low Cost, High Speed BiFET Op Amp

AD712-EP

FEATURES

- Supports defense and aerospace applications (AQEC standard)
- Military temperature range (-55°C to +125°C)
- Controlled manufacturing baseline
- One assembly/test site
- One fabrication site
- Enhanced product change notification
- Qualification data available on request
- Enhanced replacement for LF412 and TL082
- AC performance**
 - Settles to $\pm 0.01\%$ in 1.0 μ s
 - 16 V/ μ s minimum slew rate
 - 3 MHz minimum unity-gain bandwidth
- DC performance**
 - 150 V/mV minimum open-loop gain
 - Available in a SOIC_N package

GENERAL DESCRIPTION

The AD712-EP is a high speed, precision, monolithic operational amplifier offering high performance over the military temperature range of -55°C to +125°C. Its low offset voltage and offset voltage drift are the results of advanced laser wafer trimming technology. These performance benefits allow the user to easily upgrade existing designs that use older precision BiFET or bipolar op amps.

The superior ac and dc performance of this op amp makes it suitable for active filter applications. With a slew rate of 16 V/ μ s and a settling time of 1 μ s to $\pm 0.01\%$, the AD712-EP is ideal as a buffer for 12-bit digital-to-analog converters (DACs) and 12-bit analog-to-digital converters (ADCs) and as a high speed integrator.

The combination of excellent noise performance and low input current also make the AD712-EP useful for photodiode preamps. Common-mode rejection of 88 dB and open-loop gain of 400 V/mV ensure 12-bit performance even in high speed unity-gain buffer circuits.

The AD712-EP is available in an 8-lead SOIC_N package.

Additional applications information is available in the [AD712](#) data sheet.

¹ Input offset voltage specifications are guaranteed after 5 minutes of operation at T_A = 25°C.

² Bias current specifications are guaranteed maximum at either input after 5 minutes of operation at T_A = 25°C. For higher temperatures, the current doubles every 10°C.

³ Defined as voltage between inputs, such that neither exceeds ±10 V from ground.

⁴ Typically exceeding -14.1 V negative common-mode voltage on either input results in an output phase reversal.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage	$\pm 18\text{ V}$
Internal Power Dissipation ¹	
Input Voltage ²	$\pm 18\text{ V}$
Output Short-Circuit Duration	Indefinite
Differential Input Voltage	$+V_S$ and $-V_S$
Storage Temperature Range	-65°C to $+125^\circ\text{C}$
Operating Temperature Range	-55°C to $+125^\circ\text{C}$
Lead Temperature Range (Soldering 60 sec)	300°C

¹ Thermal characteristics: 8-lead SOIC_N, $\theta_{JA} = 100^\circ\text{C}$.

² For supply voltages less than $\pm 18\text{ V}$, the absolute maximum voltage is equal to the supply voltage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

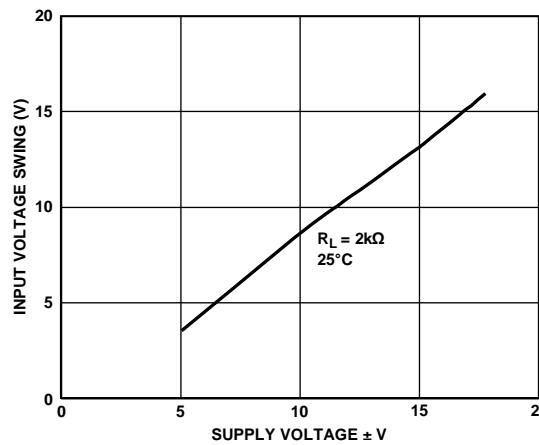

ESD CAUTION

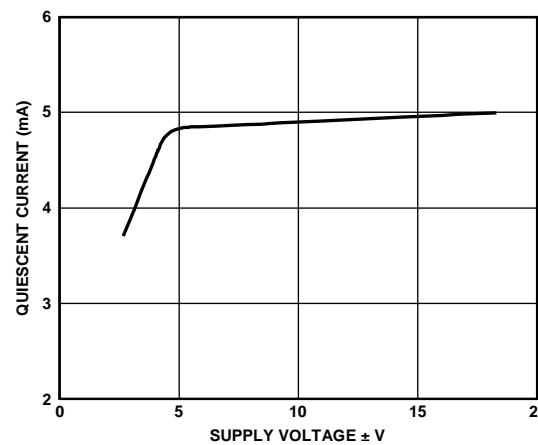

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
